

Blindshapers - Arch Factsheet

Measuring an Arch that has to be in 2 blind tracks

These measurements are needed because the window has to be split into 2 blinds.

The end components/vanes will not tilt or move on semi circular arches as if they did they would foul the ones next to them.

They will tilt only and NOT draw unless they're within the 6 - 1 ratio of $B \times 6 = \text{less than } A$
